Form Events & Input Validation with DOM in JavaScript Assignment

PW EARNERS : Coding and Web Development

By : Nishant Saini Sir

LEC - 41

Topics Covered

- submit event
- input event
- change event
- focus event
- blur event
- Form Validation
- Input Validation using DOM
- Regular Expressions (Regex) in Validation

Section 1 – Form and Input Events

1. Handle Form Submit Event

Create a simple form with a name input and submit button. Use the submit event to display a message when the form is submitted.

Example:
Input:
Name: Rahul
Output:
Form submitted successfully!

---

2. Prevent Form Submission

Create a form with a submit button and use preventDefault() inside the submit event to stop the page from refreshing.

Example:
Expected Result:
When the user clicks Submit, the form should not reload the page.

---

3. Display Input Using the input Event

Create an input field and use the input event to display the value entered by the user in a paragraph.

Example:
Input:
JavaScript
Output:
You entered: JavaScript

---

4. Detect Changes Using the change Event

Create a <select> dropdown containing three programming languages. Use the change event to display the selected language.

Example:
Options:
HTML
CSS
JavaScript
When JavaScript is selected:
Selected Language: JavaScript

---

5. Handle the focus Event

Create an input field and use the focus event to change its border or background color when the user clicks inside it.

Example:
Before Focus:
Normal input style
After Focus:
Input border changes.

---

6. Handle the blur Event

Create an input field and use the blur event to display a message when the user moves away from the input field.

Example:
After leaving the input:
You left the input field.

Section 2 – Basic Form Validation

7. Validate a Required Name Field

Create a form with a name input. When the form is submitted, check whether the name field is empty. Display an error message if it is empty.

Example:
Input:
Name:
Output:
Name is required.

---

8. Validate Email Field

Create a form with an email input and check whether the email field is empty during form submission. Display an appropriate message if no email is entered.

Example:
Input:
Email:
Output:
Email is required.

---

9. Validate Password Length

Create a password field and validate that the password contains at least 6 characters.

Example:
Input:
Password: abc
Output:
Password must be at least 6 characters.

---

10. Validate Multiple Form Fields

Create a form containing name, email, and password fields. On submission, check whether any of the fields are empty and display an appropriate error message.

Example:

Input:
Name: Rahul
Email:
Password: 123456
Output:
Email is required.
